Design Reference

1. Recommended circuit

All the DC/DC converters of this series are tested according to the recommended circuit (see Fig. 2) before delivery.

If a further decrease of the input and output ripple is required, properly increase the input & output of additional capacitors C_{in1} , C_{in2} , C_s and C_{out} ; or select capacitors of low equivalent impedance like series capacitor, etc. C_s is used to reduce ripple. No need to add C_s , if ripple meets the demand. Appropriate filter capacitance shall be chosen, start-up problems may be caused if the capacitance is too large. For each output circuit, under the condition of safe and reliable operation, the max. capacity of its filter capacitor should be lower than the max. capacitive load.

V_{in}	5VDC&12VDC	24VDC&48VDC
C_{in1}	100 μ F/25VDC	10 μ F/100VDC
C_{in2}	47 μ F/25VDC	1 μ F/100VDC
L_{in}	4.7 μ H-12 μ H	
C_s	10 μ F-22 μ F/50VDC	
C_{out}	100 μ F/50VDC(Typ.)	
C_d	47nF/100V

LDM1	12 μ H	12 μ H	12 μ H	12 μ H
C0	680 μ F/25V		330 μ F/50V	330 μ F/100V
C1	4.7 μ F/50V			4.7 μ F/100V

C3	Refer to the Cout in Fig.2			
CY1	1nF/3kV			
D1	RB160M-60V/1A			
R	In accordance with the formula: $R = \frac{V_C - V_D - 1.0}{I_C} - 300$			
Cd	47nF/100V			

Note:

- ① Part ① in Fig. 3 is used for EMS test while part ② is used for EMI filtering; and parts ① and ② may be selected based on needs.
- ② V_C is the voltage of the Ctrl end relative to the GND of the input grounding; V_D is the positive-going conduction pressure drop of D1; I_C is the current flows into the Ctrl end and its value is generally 5-10mA, see Fig. 3-③ for the peripheral circuit of Ctrl end;
- ③ If there is no recommended parameters, no external component is required.

3. Ctrl end

The modules are of normal output when the Ctrl end is suspended or of high resistance; the modules turn off when connecting with high level (relative to the input grounding); notice that the current flows into the pin shall be 5 - 10mA, the modules will be permanently damaged if the current exceeds its max. value (20mA in general).

The value of R can be derived as follows:

$$R = \frac{V_C - V_D - 1.0}{I_C} - 300$$

For Detailed parameter, please refer to EMC solution-recommended circuit in this manual.

4. Input current

When the electricity is provided by the unstable power supply, please make sure that the range of the output voltage fluctuation and the ripple voltage of the power supply do not exceed the indicators of the modules. Input current of power supply should afford the flash startup current of this kind of DC/DC module(see Fig. 5).

Generally: Vin= 5V series Iave =1315mA
 Vin=12V series Iave =631mA
 Vin=24V series Iave =303mA
 Vin=48V series Iave =158mA

Fig. 5

5. Output load requirements

When using, the minimum load of the module output should not be less than 5% of the nominal load. In order to meet the performance parameters of this datasheet, please connect a 5% dummy load in parallel at the output end, the dummy load is generally a resistor, please note that the resistor needs to be used in derating.
